Turning Knowledge into Meaning: TKN • Semantic Tokenization • AI-Enhanced Protection | Founder, Protex SCP | Creator, SAI – Semantic Artificial Intelligence, Reasearcher at Hash&Byte, #HashDEV Impacter

Deva, Hunedoara, România

## Rezumat

I architect AI-powered semantic systems that transform raw information into protected, structured, and monetizable meaning.

Founder of Protex SCP — the world's first Semantic Content Protection platform.

Creator of TKN (Tokenized Knowledge Notation) — a breakthrough method for semantic tokenization, enabling:
• granular access control
• context-aware personalization
• semantic encryption
• explainable AI
• and logical, non-hallucinatory reasoning.

I don't write code — I design meaning-based architectures using 10+ advanced AI models.
Together, we've built a new foundation for:
• Interpretable & Responsible AI
• Fractal ASI (Artificial Semantic Intelligence)
• Low-resource reasoning systems with persistent memory

Key Applications:
• Secure publishing and pay-per-fragment journalism
• Personalized learning systems with audit trails
• Legal & government document flow control
• BIM/CAD teams working on confidential infrastructure

Long-term vision: a new semantic economy, where content is encrypted at meaning level, and access is adaptive, justifiable, and valuable.

I am looking to connect with experts, co-founders, or research institutions willing to validate, challenge, and develop this further.

# This isn’t about protecting text — it’s about protecting meaning. And that changes everything.
