Certifications

R Programming
Improving Deep Neural Networks: Hyperparameter tuning, Regularization and Optimization
Practical Machine Learning

Honors-Awards

Best Paper 2010-2011 School Year

Publications

Android in Action, Second Edition
Unlocking Android: A Developer's Guide
BUILDING AN ANDROID TO-DO APP WITH PHONEGAP, HTML AND JQUERY
Cyber and Information Threats to Seaports and Ships in Maritime Security, Second Edition: An Introduction 2nd Edition by Michael McNicholas
Building smarter wearables for healthcare, Part 2, Designing cognitive applications that take advantage of the Watson services

Patents

Distributed Wireless Communications for Tactical Network Dominance

Robi Sen

CEO
Richland, Washington, United States

Summary

I am an inventor, engineer, and futurist focused on solving the complex challenges of our time through deep, disruptive innovation. My work spans counter-autonomy/AI, biodefense, and advanced electronic warfare systems, reflecting a commitment to advancing technology in defense of national and global security.

In 2008, I co-created Mesmer, a pioneering system capable of safely landing hostile drones, anticipating the Counter-Unmanned Aerial Vehicle (C-UAV) market before it formally existed. This early success reflects my ability to foresee and shape emerging technological frontiers.

My career includes collaborations with DARPA, NASA, DOE, and the Department of Defense, where I've contributed to cutting-edge programs that redefine what's technically and operationally possible. I hold a portfolio of patents and have authored publications that influence the trajectory of defense and dual-use technologies.

I work to give my clients a decisive edge through transformative products, services, and capabilities. If you're ready to build what comes next, let's collaborate.

Experience

Cognoscenti Labs LLC

Chief Executive Officer
July 2019 - Present (7 years)
Richland, Washington, United States

In this role, I lead an applied research firm focused on counter-autonomy and resilient multi-agent systems across RF, optical, and AI domains. My work involves extensive use of AI, including Gen AI and LLM. CNN, LTSM, Grammar NN, and several more. I was a very early advocate for only using LLMs in locked-down environments and demonstrated their vulnerability

System and Method for Performing Frictionless Collaboration for Criteria Search

LPI/LPD Communication Systems

Intrusion detection and radio fingerprint tracking

to simple attacks. I've used LLMs to create cyber test and analysis ranges and tools, and AI-driven "digital twin" environments to simulate and forecast complex cyber, electronic warfare (EW). At Cognoscenti, I developed new methods and patented technology for telecommunications, information transport, autonomous systems, and MCU. I have personally secured millions in research contracts from AFRL, SOCOM, and the Kostas Research Institute while serving as a senior technical advisor to DoD organizations on next-generation EW, AI/ML, sensing, and adversarial AI.

Department 13, LLC

Founder, Partner, CTO

February 2010 - November 2018 (8 years 10 months)

McLean, Virginia, United States

DEPARTMENT 13 INC | Founder, Chief Architect, & Principal Investigator | 2006 – 2018 As the founder of Department 13, I led the company to a $250M valuation and a successful public listing while raising $23.6M in capital. I invented MESMER, the first protocol-manipulation C-UAS platform, and transitioned the technology from early research to worldwide operational deployment for military and civilian users. During this time, I served as a Principal Investigator on multiple projects for DARPA and OSD programs delivering software-defined electronic warfare capabilities. I pushed the use of open source, and several employees contributed to popular open-source projects.

Twin Technologies, Inc.

Managing Partner

2007 - 2014 (7 years)

McLean, Virginia, United States

Led strategic technology consulting and enterprise architecture engagements for U.S. government and Fortune 500 companies. Ran a government department where I helped sell services and third-party enterprise products. I grew a Department of Labor Workers' Compensation project from $75K to nearly $5M in 5 years. My leadership drove innovation and modernization among government customers, resulting in tens of millions in revenue.
In my role as an architect and technology evangelist, I helped billion-dollar companies with the decision-making and process of moving to cloud architectures or new software platforms, including open-source or proprietary solutions costing millions. This often requires rapidly building functional prototypes or MVPs to help clients understand capabilities.

Granularity Information Architecture
Partner, Vice President of Software Development
August 1998 - February 2002 (3 years 7 months)

Cofounded Granularity and was Vice President of Software.
Grew company from two employees to fifty active workers.

Instituted project management practices and software development practices including the use of UML and Patterns for Web Applications long before these where popular practices.

Worked on internal Intellectual Property and products including the XML tool GIAX which was the first common usage mapping names to XML node for simpler and easier parsing .

Managed multiple large accounts.

Worked directly with customers on complex EAI projects helping integrate Web Applications with ERP’s and low level back office systems.

Championed the company as well as emerging technologies of the time including XML, Web Services, and the like.

Education

Norwich University
Masters, Military History · (2008 - 2010)
