Data Engineering

Jeff Gilliland

Software Engineer
Vienna, Virginia, United States

Summary

I am a passionate Software Engineer who loves to dive deep into complex problems and provide working solutions, while working directly with end users and teammates. I enjoy designing and developing back-end services, as well as focusing on the front-end web stack for meaningful data visualization and user experiences. I have over 15 years of professional experience and knowledge in several languages.

My recent focuses have been on web technologies, primarily in Javascript / Typescript (including modern frameworks like Angular and React) and NodeJS (along with NestJS). I've also been involved heavily with backend development and diving into the world of data engineering along with data science. I have a wealth of experience designing and managing databases, from SQL (MS-SQL, PostgreSQL, etc.), NoSQL (Mongo / Cassandra) to Graph Databases (Neo4j). In addition, I have experience with containerization, building microservices, and deploying with Docker and Kubernetes.

In the future, I'm looking to work with a team of enthusiastic, skilled individuals that are devoted to delivering quality software using modern technology stacks to solve complex business problems.

Experience

Palantir Technologies
Forward Deployed Software Engineer, Tech Lead
July 2025 - Present (1 year)
District of Columbia, United States

Amazon Web Services (AWS)
System Development Engineer II
May 2025 - July 2025 (3 months)
Herndon, Virginia, United States

Parsons Corporation

7 years 1 month

Principal Software Engineer

December 2024 - May 2025 (6 months)

Centreville, Virginia, United States

Worked on a USARPAC CDO data platform, focused on data engineering, architecting & building backend services, along with front end application development and enhancement.

• Rebuilt existing slow, costly ETL pipeline, saving customer over $50k / month on cloud costs and improving data pipeline processing and enrichment speeds by 5-fold. Ingesting and processing hundreds of millions of documents per day.
• Enhanced frontend applications with additional features such as:
• Visualization deep dives into aggregated analytics
• Aggregated document summarization
• Entity highlighting and topic extraction
• Maintained, architected and developed customer AWS cloud environment: Kinesis, Lambda, EC2, ECS, VPCs, RDS, DynamoDB, IAM, and OpenSearch clusters.
• Deployed CI/CD pipelines for automating deployments across multiple environments.
• Deployed Dagster on Docker allowing for orchestration, catalogging, and horizontal scalability of ETL pipeline.
• Implemented data analytics on large datasets, including NER, Relevancy Filtering, and optimizing Elasticsearch aggregation queries.
• Supported AI/ML/RAG deployments through MLOps and adding document summarizers for user's queries.
• Mentored and tech lead for team of 10, providing overall guidance on a diverse functional skillset to include Data Scientists, Software Engineers, and Cloud Engineers while interfacing directly with customer.

Principal Software Engineer

December 2022 - December 2024 (2 years 1 month)

South Korea

• Led and architected for a team of engineers, implementing software engineering best practices while building out a new Kubernetes platform, including continuous integration, and containerization for efficient development and deployment workflows.
• Transformed a legacy Java and SQL-based system into a containerized microservice backend deployed on Kubernetes, optimizing ETL processes,

data access, and authentication functionalities, resulting in improved performance and security.
• Enhanced capability and performance by rewriting legacy front-end capabilities using React, while integrating diverse application capabilities such as viewing, briefing, editing, and analytics to unify the user experience.
• Supported multiple military exercises by maintaining and rapidly developing features for a system used by thousands of concurrent users, handling millions of requests, that provides critical data to senior leadership.
• Developed a swim lane calendar application to streamline ad-hoc scheduling, event categorization, and customizable views, driving operational efficiency and enhancing coordination across military commands.

Senior Software Engineer / Site Lead
May 2018 - December 2022 (4 years 8 months)
Stuttgart, Germany

Supporting site customers by developing web applications and scalable microservice architectures utilizing docker containers to meet rapidly emerging requirements in support of command data office.

▪ Developed a dynamic, customizable form-based reporting system using Angular with a Node.js + SQL backend for collecting ad-hoc structured data which informs military operation planning and campaign assessments via user configurable visualizations and dashboards.
▪ Created a web-based Operation Risk Assessment tool that streamlines pre-mission risk planning; integrated into operation planning processes and is now used across the SOCOM enterprise as a best practice for mission risk assessment.
▪ Developed a system that allows for the management of various entities that go into operations management and the assignment of personnel to those operations.
▪ Developed a mobile application for partner forces that enhances their situational awareness and allows them to report on various facets of their unit which enhances their coordination and C2 capabilities
▪ Built E.T.L capabilities for ingesting disparate data sources into a data brokerage system, assisting with data analytic tasks.
▪ Made a talent management application that saves senior leadership hundreds of hours of time on quarterly staff evaluations.
▪ Mentored junior engineers at the command by providing positive feedback, instructional lessons, and delegating engineering tasks.

▪ Assisted with architecting command's data plan and implemented CDO's vision by building out backend services in support, from Data Lakes, Warehouses to Marts.
* Implemented robust software operation capabilities by migrating legacy system into Docker containers along with CI/CD DevSecOps pipelines

Intelligent Software Solutions - A Polaris Alpha Company
7 years 1 month

Field Software Engineer
March 2015 - May 2018 (3 years 3 months)
Camp Smith, Hawaii

▪ Architected web applications and automated processes based on geospatially diverse customer requirements and policies while at SOCPAC HQ, and during on-site visits to other countries.
▪ Combined custom JavaScript visualizations into a single page dashboard, providing a one-stop shop for analyzing and receiving situational awareness on military operations utilized by hundreds of SOF personnel and senior leaders at SOCPAC.
▪ Automated various staff tasks via PowerShell for report generation and data driven emails saving users hundreds of hours.
▪ Maintained application servers through domain management, database and system administration duties.
▪ Trained and briefed hundreds of users on system usages and capabilities.
▪ Integrated various custom web components with Microsoft SharePoint, streamlining the user experience to one product.
▪ Worked with IA to ensure system compliance by keeping systems patched and accredited based on command policy.
▪ Synchronized development and code management strategies with other deployed teams.

Software Engineer
December 2013 - March 2015 (1 year 4 months)
Colorado Springs, Colorado Area

Worked on an enterprise data analytic web application using Javascript Frameworks (with backbone, angular, d3js, etc.). Built dynamic displays using d3js, such as charts, link analysis, graphs, tables and maps.

• Assisted in migrating client based capabilities towards a new service based (SOA) enterprise stack

• Helped build a reusable component and data visualization library in JavaScript using jQuery, AngularJS, Backbone, D3.js

Field Engineer
July 2013 - December 2013 (6 months)
Seoul, Korea

Responsible for developing and maintaining ISS products for 8th Army in South Korea. Created new domains to help collate data using a SQL backend and ISS developed products, CIDNE and WebTAS. Created custom input forms based on customer requirements. Maintained and developed various web service components for communicating cross-domain. Helped with system administration duties from server maintenance to database maintenance. Interfaced directly with military customers for both requirements generation and training on software systems.

Software Engineer
May 2011 - July 2013 (2 years 3 months)
Colorado Springs, Colorado Area

Worked on maintaining and developing code for ISS's main product. Developed using various Java technologies, including Swing and JavaFX. Responsible for creating solutions to solve bugs and implement new designs from various aspects of the program including: GUI redesign work, modifying data querying methods, HTTP/REST development, and improving user experience through automation (amongst many other tasks).

• Feature development and maintenance for a Java based data analytic desktop client. Fixed hundreds of bugs while also doing feature enhancement such as Swing and JavaFX GUI redesign, data model designs, and developing REST API interfaces

Education

University of Colorado Colorado Springs
Bachelor of Science (BS), Computer Engineering · (2007 - 2013)
