Human-Machine Integration
Human-Machine Trust
Real-World Experimentation

Jason Metcalfe

Consequence Focused Innovation for [Humanity]'
Columbia, Maryland, United States

Summary

Seasoned senior scientist, applying understandings of humans toward solutions in domains like sensory-motor development, reinforcement learning, trust in autonomy, human-machine teaming, and military integration since 2004, with a present and growing focus on translating science and technology insight into actionable guidance for institutional change, public interest, and democratic accountability.

An inclusive leader and community-builder, emphasizing mentorship, LGBTQ+ support & organizing, and 1,200+ hours of in-situ group facilitation and intercultural competence training.

From roles across government, academia, and international consortia, I have collaboratively designed and led interdisciplinary research and development that informs strategic science investment and technology governance priorities, shaping responsible innovation pathways in public-interest domains for defense and civil science.

Experience

Human In.Sites, LLC

Founder
January 2026 - Present (6 months)
Regional Mid-Atlantic (MD base), USA

As the founding member, I am stewarding a vision of a strong international collaborative network for scientists, by scientists ... and their allies.

In 2025, the United States demonstrated broadly across all sectors that benefit from the free employment of scientists and knowledge workers (government, corporate, and academic alike), that the individual human who produces the knowledge is not a valued and protected asset. Instead, all sectors have

managed to divorce the producer from the insights they produce, and are willing to sacrifice those producers in hopes of protecting their products.

Indeed, because the products are sold for income, the producers are viewed as necessary costs of business rather than value producing assets. While corporations invest millions upon millions to protect branded products and reputations, they assume the skilled people who made those things are ultimately replaceable.

Humanity, I believe, has things all topsy-turvy in this way.

Human In.Sites, LLC was founded on the principle that humans co-create a shared existential reality and therefore it is they that have the ultimate value to be nurtured and guarded. Products come and go, people provide the core continuity.

I am here to support a formalized organization that aims to give real administrative and community-grounded power to this bigger vision. A return to normalcy where science and knowledge creation are regarded for the artful, careful, and skilled practices that they are and have always been.

An extension into a new reality where these same enterprises stand accountable for the breadth and consequence of their impact on humanity in turn.

Human In.Sites is here to be an organization that brings together world class talent meant to extend the richness and vitality that must underlie human experience.

U.S. Army Research Laboratory
Senior Science Lead
December 2015 - September 2025 (9 years 10 months)
Aberdeen Proving Ground, MD, USA

As a senior science lead within a designated DoD Science & Technology Reinvention Laboratory [https://rt.cto.mil/ddre-rt/science-and-technology-foundations/strl/], I drive multi-disciplinary efforts that blend science, technology development, and strategic advising. My role spans that of co-authoring and co-executing large-scale R&D programs, such as Autonomy Research Pilot Initiative, "Privileged Sensing Framework" program, through public communication and network building, as with the Center for Agent

Soldier Teaming, and ultimately, to leverage real-world grounded insights towards shaping national approaches to human-machine teaming, responsible AI, and socio-technical integration. I operate at the interface of research and decision-making, helping senior leaders, policymakers, and operational stakeholders interpret emerging technologies through the lens of institutional readiness, ethical foresight, and public value.

TNO

Visiting Scientist

November 2021 - November 2022 (1 year 1 month)

Soesterberg, Utrecht, Netherlands

Selected for an international exchange program for emerging senior S&T leaders, I collaborated with NATO-aligned researchers and policymakers to shape discourse around responsible AI and autonomy in high-risk, defense-adjacent ecosystems. My work combined applied science with strategic network-building across transatlantic institutions to advance ethical technology development and policy readiness.

DCS Corporation

Applied Researcher and Systems Scientist

August 2007 - December 2015 (8 years 5 months)

Served as both technical lead and strategic partner to the U.S. Army's R&D leadership, supporting the design and execution of pioneering programs in autonomy, human-machine teaming, and cognitive systems. Beyond science execution, I played a key role in technical program shaping, stakeholder engagement, and cross-organizational coordination—helping to stand up major efforts like the $50M CaN CTA and contribute to successful, mission-aligned funding strategies. This role blended applied science with the realities of business development, interagency alignment, and trusted advisory support to federal sponsors.

University of Maryland, College Park

9 years 10 months

Faculty Lecturer

August 2004 - May 2007 (2 years 10 months)

Taught courses in human development, biomechanics, kinesiology and quantitative methods/computing for human movement studies

Graduate Assistant & Doctoral Fellow

August 1997 - July 2004 (7 years)

1999 - 2003: Provided research support for studies of human development and develomental motor control.
2003-2004: Graduate teaching assistant (human motor development)

Education

University of Maryland

Ph.D., Kinesiology (human development, biomechanics and computational neuroscience) · (2007)

University of Illinois Urbana-Champaign

M.S., Kinesiology (human development, biomechanics and motor control) · (January 1998)

University of Illinois Urbana-Champaign

B.S., Kinesiology · (1995)
