Michael Plyasunov

Infrastructure and platform engineer. I focus on designing and building platform automation. Email: cartesius.absolute@gmail.com
Russia

Summary

Stack: Golang, Python, Zig, Linux, AWS, Ansible, SaltStack, Terraform, Terratest, K8s, Helm, ArgoCD, Jenkins, Gitlab, Kafka, VictoriaMetrics, OpenSearch, Zabbix, YARA, Chef, Puppet, CFEngineGolang and python development for infrastructure services. Developed and maintained cloud observability integrations from scratch. This included a service consuming and enriching cloud metrics from Kafka for VictoriaMetrics, and a webhook server aggregating cloud audit events (IAM, disk/cluster changes) into a DB with Telegram reporting. Both services utilized Go hexagonal architecture and concurrency patterns (worker pools, fan-in, pipelines), deployed via ArgoCD and Helm.Extensive work with Ansible, including acting as the team's technical expert. Used custom modules, filters, plugins, dynamic inventories, etc., in production solutions. Among other configuration management systems, I have some experience with Chef and CFEngine as part of a pilot to replace Ansible (eventually, SaltStack was chosen; see the next point for details).Extensive work with SaltStack: migrated infrastructure roles into Salt formulas and developed custom modules (specifically pillars, returners, and states). Took an active part in designing the master layer architecture (how minions communicated with masters and how fault tolerance was handled); conducted R&D for various Salt-specific solutions (storing events in OpenSearch, for which, by the way, I had to create a separate module because only old versions of Elastic were supported).Development and use of compact (and not so compact) Python solutions for infrastructure automation and security tasks: a Python wrapper for YARA rules to scan custom rules across the entire infrastructure; tons of automation scripts for daily routine tasks (mostly using Invoke); a script for integrating Zabbix with Vulnerability Manager, and much more.Design and implementation of Jenkins as a Service. Architected a hybrid setup (controller in K8s, agents on VMs) managed by sidecar scripts for event-driven automation. This achieved a full GitOps cycle and improved

fault tolerance for maintainers, while providing a seamless UX for developers (creating multibranch jobs via a single line in Helm values). The system supported easy feature testing and scaling across multiple instances.Development of Terraform modules and a pipeline for its application. Developed tests for Terraform using Terratest and the native testing framework. Also, occasionally had to deal with "raw" state, mostly in tasks involving migration to new module development standards.

Experience

Domclick
Platform engineer
October 2023 - Present (2 years 9 months)
